Cash System.

BREAKPOINT IPC

INTEGRATED PROGRAM CONFIGURATOR

The BreakPoint IPC is a true 100% Windows GUI complaint product designed to permit you to perform service programming for multiple BreakPoint systems in realtime with live cashier operations. The IPC is designed to auto-detect all of the BreakPoint workstations residing within your Windows98/NT network and present them on the screen to program one at a time individually, all collectively, or as a selective group.

The BreakPoint IPC presents the same programming options as the BreakPoint Systems Menu, but in a friendly Windows GUI multi-lane programming environment. Programming facilities that are supported by the BreakPoint IPC include:

- ▶ System Flags with Flag Search Field
- ▶ Alpha Descriptor Programming
- ▶ Department Programming
- ▶ Tender Programming
- ▶ Clerk Programming
- ▶ Tax Programming
- ▶ Discount Programming
- ▶ Data Capture Programming
- ▶ Mix and Match Programming

All system flag screens are accompanied by a helpful wordwheel description search that can isolate groups of similar flags for easy checking and updating. Tender and Department screens may be scrolled forward and backward for a quick review of programmed information.

The BreakPoint IPC is protected by a special security lock that verifies the programming authorization level of all operators by secret code entry. Clerks not properly authorized are restricted access to programming operations.

Keyboard Functions, Data Captures, and Data Capture Special Events may all be assigned and selected by Name and scrolled forward and backward. Multiple register programming may be effected quickly and easily with a single entry, with programming changes recorded and activated instantly as they are entered.

The BreakPoint Retail Cash System includes the following components:

- ▶ BreakPoint Retail Cash System
- ▶ ICD Integrated Customer Display
- ▶ IPC Integrated Program Configurator
